Overview of toothed belt and spindle axes

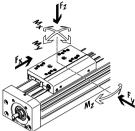

Toothed belt axes

- Speeds of up to 10 m/s
- ullet Acceleration of up to 50 m/s 2
- Repetition accuracy of up to ±0.08 mm
- Strokes of up to 8500 mm (longer strokes on request)
- Flexible motor mounting

Spindle axes

- Speeds of up to 2 m/s
- ullet Acceleration of up to 20 m/s²
- Repetition accuracy of up to ±0.003 mm
- Strokes of up to 3000 mm

Key features

At a glance Powerful

Generously sized profiles with an optimised cross section afford maximum rigidity and load capacity

• Speed, acceleration and torque resistance set a new standard

Economical

- In addition to its technical data, the toothed belt axis also offers an excellent price/performance ratio
- Due to the EGC's high performance it is often possible to use a smaller size

Versatile

- Numerous sizes and variants such as protected guides open up a broad range of applications
- Space-saving position sensing with proximity sensors in the profile slot is possible
- Wide range of options for mounting on drives
- Comprehensive range of mounting accessories for multi-axis combinations

Flexible motor attachment

The motor position can be freely selected on four sides and can be changed at any time.

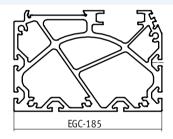

Comprehensive range for the most varied load conditions

Characteristic values of the axes

The specifications shown in the table are maximum values.

The precise values for each of the variants can be found in the relevant technical data in the catalogue.

Key features

Slide variants

Standard slide

Additional slide

Guide optionsProtected version

 The protected guide cleans the guide rail and protects the recirculating ball bearing guide with the aid of an additional wiper

With central lubrication

 The lubrication adapter enables the guide to be permanently lubricated using semi or fully automatic relubrication devices

→ 23

- The adapters are suitable for oils and greases
- Both lubrication adapters must be connected

Displacement encoder

 The position of the slide can be sensed directly when using the incremental displacement encoder. This means that all elasticities of the drive train can be detected and can be corrected by the motor controller

Clamping unit

- 1 or 2-channel design, for holding loads
- Reliable holding is guaranteed since the forces act directly on the
- A limited number of emergency braking operations are permissible with the sizes 120 and 185

FESTO

Technical data

Characteristic load values

The indicated forces and torques refer to the slide surface. The point of application of force is the point where the centre of the guide and the longitudinal centre of the slide intersect.

These values must not be exceeded during dynamic operation. Special attention must be paid to the cushioning phase.

Max. permissible forces	Max. permissible forces and torques for a service life of 5000 km										
Size		50	70	80	120	185					
Fy _{max} .	[N]	650	1850	3050	6890	15200

My _{max.} /Mz _{max.}					·						
EGCGV/-GQ	[Nm]	-	132	228	680	1820					

Note

For a service life of 5000 km for the guide system, the load comparison factor must have a value of fv < 1,

based on the maximum permissible forces and torques for a service life of 5000 km.

If the axis is simultaneously subjected to several of the indicated forces and torques, the following equation

must be satisfied in addition to the indicated maximum loads:

Calculating the load comparison factor:

$$f_v = \frac{|F_{y,dyn}|}{F_{y,max}} + \frac{|F_{z,dyn}|}{F_{z,max}} + \frac{|M_{x,dyn}|}{M_{x,max}} + \frac{|M_{y,dyn}|}{M_{y,max}} + \frac{|M_{z,dyn}|}{M_{z,max}}$$

Technical data

Calculating service life

The service life of the guide depends on the load. To provide a rough indication of the service life of the

guide, the graph below plots the load comparison factor f_{V} against the service life.

These values are only theoretical. You must consult your local contact person

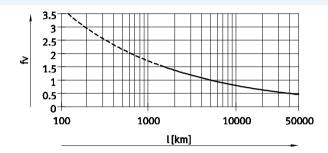

at Festo for load comparison factors f_{ν} greater than 1.5.

Load comparison factor f_v as a function of service life

Example:

A user wants to move an X kg load.
Using the formula → 16 gives a value of 1.5 for the load comparison factor f_v. According to the graph, the guide would have a service life of

approx. 1500 km. Reducing the acceleration reduces the Mz and My values. A load comparison factor $f_{\rm V}$ of 1 now gives a service life of 5000 km.

- 🖣 - Note

PositioningDrives sizing software www.festo.com The guide workload for a service life of 5000 km can be calculated with the help of the sizing software.

f_V > 1.5 are only theoretical comparison values for the recirculating ball bearing guide.

Comparison of the characteristic load values for 5000 km with dynamic forces and torques of recirculating ball bearing guides

The characteristic load values of roller bearing guides are standardised to ISO and JIS using dynamic and static forces and torques. These forces and torques are based on an expected service life for the guide system of 100 km to ISO or 50 km to JIS.

As the characteristic load values are dependent on the service life, the max. permissible forces and torques for a service life of 5000 km cannot be compared with the dynamic forces and torques of roller bearing guides to ISO/JIS.

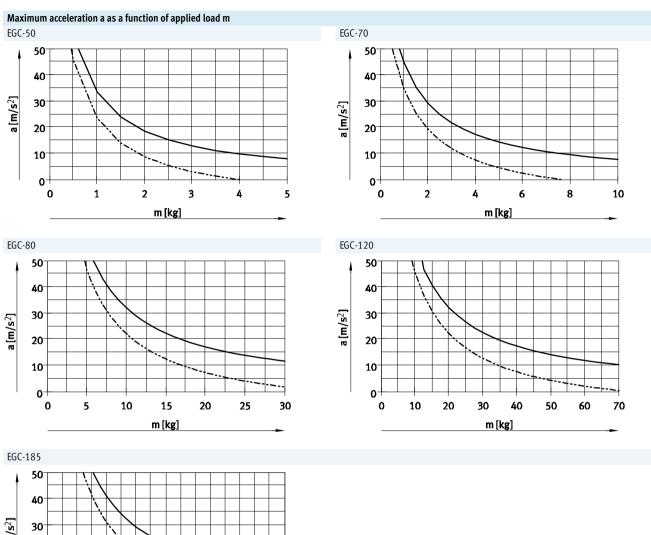

To make it easier to compare the guide capacity of linear axes EGC with roller bearing guides, the table below lists the theoretically permissible forces and torques for a calculated service life of 100 km. This corresponds to the dynamic forces and torques to ISO.

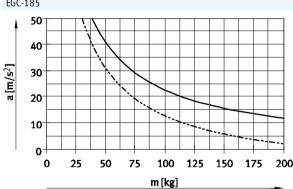

These 100 km values have been calculated mathematically and are only to be used for comparing with dynamic forces and torques to ISO. The drives must not be loaded with these characteristic values as this could damage them.

Max. permissible forces and torques for a theoretical service life of 100 km (from a guide perspective only)

Working stroke reduction

With integrated clamping unit

- The working stroke is reduced by the length of the clamping unit.
- With 1-channel clamping units, the stroke is reduced on one side with respect to the mounting surface.
- With 2-channel clamping units, the stroke is reduced symmetrically with respect to the mounting surface of the load.
- Shock absorbers must not be used in combination with the clamping unit.

Size		80	120	185

Technical data

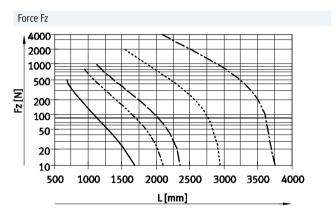

Maximum permissible support span L (without profile mounting MUE/central support EAHF) as a function of force F

In order to limit deflection in the case of large strokes, the axis may need to be supported.

The following graphs can be used to determine the maximum permissible support span I as a function of force F acting on the axis. The deflection is f = 0.5 mm.

Recommended deflection limits

Adherence to the following deflection limits is recommended so as not to impair the functional performance of

the axes. Greater deformation can result in increased friction, greater wear and reduced service life.

Size	Dyn. deflection	Stat. deflection
	(load moving)	(load stationary)
50 185	0.05% of the axis length, max. 0.5 mm	0.1% of the axis length

Technical data

Central lubrication

The lubrication adapter enables the guide of the toothed belt axis EGC-TB to be permanently lubricated in applications in humid or wet ambient conditions using semi or fully automatic relubrication devices.

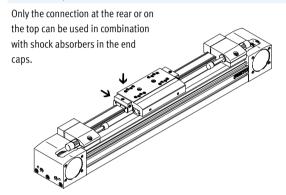

- For size 80, 120, 185
- The modules are suitable for oils and greases
- The dimensions of the toothed belt axis EGC-TB are the same with and without central lubrication modules
- Both lubrication adapters must be connected
- There are three connection options on each side
- Can be used in combination with:
 - Standard slide GK
 - Additional slide KL, KR
- Cannot be used in combination with:
- Protected recirculating ball bearing guide GP

Connection options

Connection option for customer design

The drawing opposite shows the connection option on the top lubrication interface using a customer design.

- D1 8+0.2 mm
- D2 6 mm
- $T1 \quad 0.6_{-0.05}\,mm$
- T2 $0.1^{+0.2}$ mm
- 0-ring Ø 6x1 mm (DIN3771)
- 1 Slot depth for O-ring
- 2 Required air gap

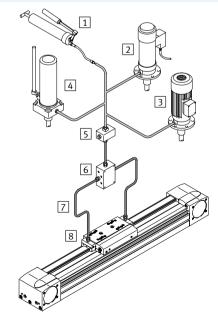

Additional dimensions → 31

Structure of a central lubrication system

A central lubrication system requires various additional components. The illustration shows different options (using a hand pump, pneumatic container pump or electric container pump) required as a minimum for designing a central lubrication system. Festo does not sell these additional components, however they can be obtained from the following companies:

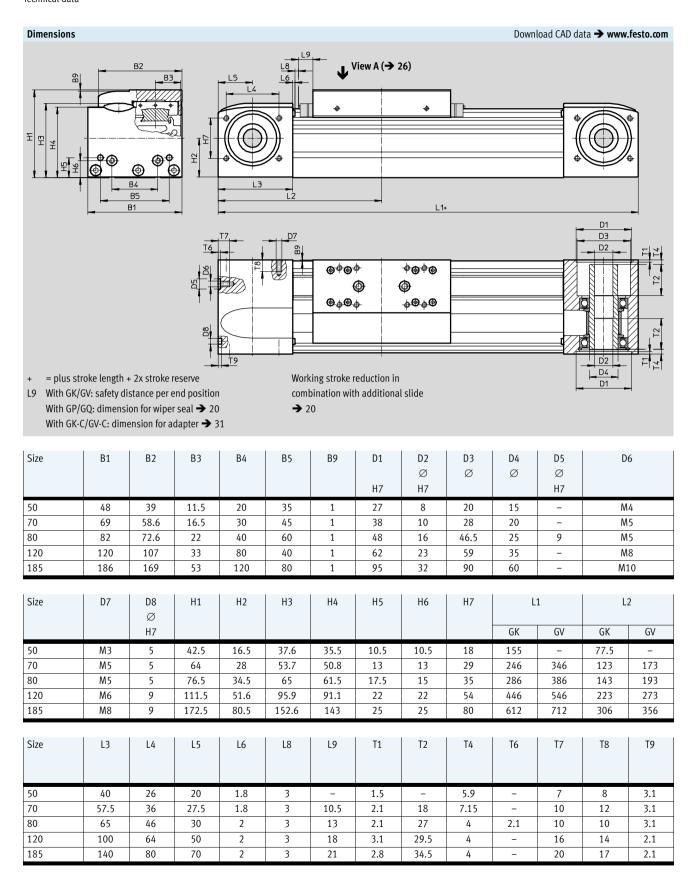

- Lincoln
- Bielomatik
- SKF (Vogel)

Festo recommends these companies because they can supply all the necessary components.

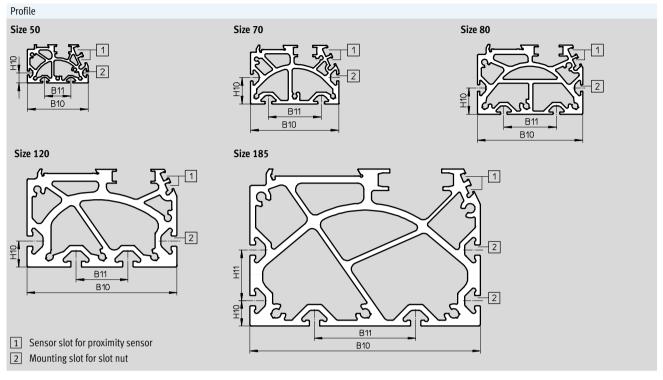

- 1 Hand pump
- 2 Pneumatic container pump
- 3 Electric container pump
- 4 Manually operated container pump
- 5 Nipple block
- 6 Distributor block
- 7 Tubing or piping
- 8 Fittings

Switch lug SF-EGC-1

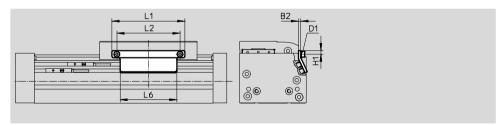

For sensing via proximity sensor SIES-8M

(order code X or Z)

Materials: Galvanised steel RoHS-compliant • With size 50, max. 3 proximity sensors can be supported when sensing both end positions. For

additional proximity sensors, a stroke reserve of 25 mm is required.

Accessorie

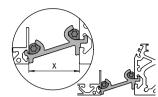

Mounting options between axis and support profile

Depending on the adapter kit, the spacing between the axis and the support profile is:

x = 20 mm or 50 mm

The support profile must be mounted using at least 2 adapter kits. For longer strokes, an adapter kit must be used every 500 mm.
